Nontuberculous Mycobacteria Reported to the Public Health Laboratory Information System by State Public Health Laboratories United States, 1993-1996

This report was prepared by W. Ray Butler and Jack T. Crawford, Tuberculosis/Mycobacteriology Branch, Division of AIDS, STD, and TB Laboratory Research, with assistance from Kathleen Shutt from the Division of Bacterial and Mycotic Diseases, National Center for Infectious Diseases, Centers for Disease Control and Prevention. Copies of this report can be accessed at <http://www.cdc.gov/ncidod/dastlr/mycobacteriology.htm>.

Commentary

Introduction

This report summarizes data on the nontuberculosis mycobacteria reported by state public health laboratories to the Public Health Laboratory Information System (PHLIS) database for the period 1993 through 1996. PHLIS was initiated in 1992 by the National Center for Infectious Diseases (NCID), Centers for Disease Control and Prevention (CDC), and the former Association of State and Territorial Public Health Laboratory Directors for the purpose of disease surveillance. All states have the ability to input data into PHLIS, through a computer-based national network. The software consists of modular screens for data entry for different diseases and can be customized to import results from other databases. The mycobacterial module includes entry fields for reporting laboratory data of public health importance for disease surveillance and control.

Notes on reporting

In the United States, physicians are requested to report disease cases involving species of the *M. tuberculosis* complex, including *M. bovis* and *M. africanum*, but they are not required to report infections involving nontuberculous mycobacteria (NTM) species. Reports of the prevalence of *M. tuberculosis* complex are published annually by the Division of Tuberculosis Elimination, National Center for HIV, STD, and TB Prevention, CDC. Therefore, the PHLIS reports presented here do not include

data on *M. tuberculosis*, *M. bovis*, and *M. africanum*.

State public health laboratories that did not report nontuberculosis species to PHLIS during the reporting period and laboratories that only reported *M. tuberculosis* isolates are not included in this report. These states included Hawaii, Massachusetts, Pennsylvania, and South Carolina.

Reporting of nontuberculosis species suspected to be involved in disease to the PHLIS system remains voluntary, and the data presented here **may reflect both over and under reporting**. Consequently, the data do not represent the absolute occurrence and distribution of the species. Trends expressed by these reports should be considered preliminary until substantiated by further testing or reporting of more complete data through PHLIS.

All mycobacteria species reported into the PHLIS database by the state health departments were counted. It is important to note that the number of isolates are presented as 'report rates' **to reflect a lack of verification of clinical significance of the report**. Since these reports were not verified, any association with clinical data should be interpreted with caution.

Presentation of data

The population estimates in the United States were determined from the annual tuberculosis reports described above. Report rates were calculated per 100,000

population for all tables except Table 1, for which calculations were made per 1 million population.

The infection caused by the BCG strain of *M. bovis* is not included in the annual report of tuberculosis in the United States because the transmission is treatment-induced. Therefore, reports of *M. bovis*, BCG, are included in this report.

Information on race/ethnicity contained in the PHLIS database was under reported and could not be presented in this report.

Note: Historically, species of mycobacteria that were not *Mycobacterium tuberculosis* were considered to be related to but different from *M. tuberculosis*, and the names assigned to them by early investigators implied this association. Terminology used to describe them include 'atypical' acid-fast bacilli, anonymous strains, 'unclassified' acid-fast bacilli, mycobacteria other than tuberculosis (MOTT), and nontuberculous mycobacteria (NTM). For the purposes of this report, this group is described as nontuberculous mycobacteria or NTM.

^aPop. represents population estimates effective July 1 for each year.

^b% is calculated as percentage of total number of reports.

^cRate indicates report rate per 1 million population, calculated to 4th decimal place (not shown).

^dSorted according to rate.
